

ARCHIT VATS

The gap between the spec and the shipped thing? I close it.

PRODUCT MANAGEMENT · SENIOR QA LEAD · GURUGRAM, INDIA · MBA CANDIDATE, DEAKIN UNIVERSITY

Seven years inside product teams — first finding what breaks, then deciding what gets built. I write the PRD, cut the scope, define the acceptance criteria, and stay until the metric moves. Open to associate and mid-level product management roles.

FAMILY OFFICE DEAL THE
TEAM WON ON POSEIDON

I own the whole road.

01 Discovery & user research

Eight conversations before a single screen — who hurts, how often, and what they do instead today.

03 Roadmaps & prioritisation

What ships now, what waits, and the trade-off written down so nobody relitigates it.

05 Quality strategy & release readiness

The unhappy path scoped up front, and an honest go/no-go on release day.

02 PRDs, stories & acceptance criteria

The decision, the non-goals, and criteria an engineer and a tester read the same way.

04 Metrics, KPIs & analytics

Success defined before the build, then checked in SQL rather than taken on trust.

06 Agile delivery & stakeholders

Sprint rituals that stay useful, and stakeholders who never learn bad news late.

Case study 01 — Poseidon

FINTECH · WEALTH ADVISORY · PRODUCT MANAGEMENT INTERNSHIP

A sales engagement platform for wealth advisors: research, omnichannel cadences and a dialer, all beside the LinkedIn profile the advisor is already looking at. I joined as a product management intern and worked the roadmap, strategy, user research and metrics behind it.

On the profile — act without leaving LinkedIn

Every channel

Measured daily

The problem

Demand for advisory services arrives in bursts tied to life events nobody is watching for — a job change, a liquidity event, a retirement window. Pipeline was episodic, trust was rebuilt from scratch every time, and growth depended on referrals the advisor couldn't schedule.

The approach

Service-as-a-Software

LinkedIn-native outbound, ICP-specific messaging and trust-building content, packaged as a repeatable engagement rather than a campaign.

A lean operating model

Standardised workflows and AI-assisted production replaced ad hoc execution, with pipeline visibility from first touch to booked meeting.

ICP discipline

Structured prospect universes and trigger-based targeting — job changes, liquidity events, retirement windows — over raw lead volume.

A measurable doctrine

Trust Inventory, Time-to-Trust and Trigger Density — first-principles ideas turned into numbers a team can act on.

RECORD-KEEPING BY DESIGN

What I took from it. Distribution is a product problem. The features that mattered were the ones that made an advisor's next action obvious — and the ones that let us prove the system worked without guessing.

Case study 02 — BoundaryOS

MBA CAPSTONE · DEAKIN · MBG772 INNOVATING USING INSIGHTS · TEAM OF FIVE

The illusion of urgency: redesigning work norms so people can disconnect with confidence in always-on cultures. Five independent field studies with nine stakeholders converged on one insight — the barrier isn't workload, it's the perceived career risk of disconnecting.

81%

feel genuinely productive

My stream

I researched a 28-year-old remote QA analyst and ran the Jobs-to-be-Done analysis. The finding — notification-checking is hired for career anxiety, not operational need — rewrote our first concept from a notification filter into a trust-based urgency classification system.

Root causes

Urgency ambiguity

Nobody can tell critical from routine, so everyone checks everything.

Cognitive spillover

Unfinished task loops stay open through the evening, preventing detachment.

Social norm pressure

Manager cues make a delayed reply feel like a career risk.

The system

110+ ideas, filtered through SCAMPER, a creative matrix and impact–effort scoring, down to three closed-loop layers plus a scaling layer.

UrgencyOS

Green / amber / red classification. Fixes urgency ambiguity.

Threshold

A four-minute capture–triage–close ritual. Fixes spillover.

NormShift

A three-week facilitated team norm sprint. Fixes social pressure.

Dashboard

Team-level analytics for HR. Sustains the change (phase 2).

How we'd know it worked. Nine hypotheses across desirability, feasibility and viability — after-hours checking –30%, detachment +25%, confidence to disconnect $\geq 70\%$, ritual under five minutes — staged over three phases with go/no-go gates and an explicit stop rule.

Where I've been.

Internship

Product Management Intern · Poseidon

Roadmap, product strategy, user research, metrics and KPIs, and stakeholder communication on a live growth problem for registered investment advisors.

Oct 2021 — present

Senior QA Lead · HashedIn by Deloitte

Lead quality for client product teams: test strategy, release readiness, and the scope and acceptance conversations around them.

Apr 2021 — Oct 2021

QA Engineer · Harmonize

Functional, regression and UI/UX testing on a fast release cadence, closest to how the product actually behaved.

Jan 2019 — Apr 2021

QA · OZONE

Manual and API testing, SQL database checks, and a test-management practice built from nothing.
